

Residency Inter-professional Education: A Pilot Study

This study will assess learners' reactions to a pilot inter-professional education (IPE) program for family medicine and physical therapy residents,' as well as explore the impact on learners' knowledge and perceptions of each profession and beliefs about collaborative practice.

Virtual Reality Study

To determine the feasibility and potential benefit of using a virtual tele-therapy system to deliver exercises to individuals with lower limb impairments due to a history of lower limb injury or surgery. Interactions and exercise performance using the tele-therapy system will be compared to exercises performed in a typical (mock) 'home exercise program' manner (i.e. with paper/written descriptions of exercises).
